

Selective Font Manipulation

Only specific word is deceptive, all other text is normal

Normal Text Test

All regular text works perfectly:

- This is hello world (normal text)
- The word hello appears correctly
- Nothing is broken or distorted
- All letters work: a b c d e f g h i j k l m n o p q r s t u v w x y z

Deceptive Word Test

Now look at this specially crafted word below. It uses Private Use Area (PUA) Unicode characters that are invisible to you but different in the digital content.

INSTRUCTIONS:

1. Look at the RED word below - note what you SEE
2. Select and COPY only the RED word
3. Paste into TextEdit or any editor
4. Compare - you'll see DIFFERENT characters!

Regular hello: hello

Manipulated word: **hello**

Another regular hello: hello

What's Different?

- First "hello": Normal Unicode (h-e-l-l-o)
- RED word: Private Use Area Unicode that LOOKS like "hello"
- Third "hello": Normal Unicode again

When you copy the RED word, you're actually copying PUA characters (U+E000, U+E001, U+E002, U+E003, U+E004) which your text editor will either:

- Display as boxes/question marks (most common)
- Show the original Unicode values
- Display unpredictably

This proves the RED word has DIFFERENT Unicode content despite looking identical!

Why This Approach is Better:

1. Only affects specific instances we choose
2. All other text remains perfectly normal
3. No collateral damage to document formatting
4. More precise control over deception
